Question by Student 201327132

$$\begin{aligned}\frac{\partial \Omega}{\partial t} &= \frac{\partial}{\partial t} (x_5 y_7 - y_5 x_7) \\ &= \left( \frac{\partial}{\partial t} \frac{\partial x}{\partial t} \right) \frac{\partial y}{\partial t} + \left( \frac{\partial}{\partial t} \frac{\partial y}{\partial t} \right) \frac{\partial x}{\partial t} \\ &\quad - \left( \frac{\partial}{\partial t} \frac{\partial y}{\partial t} \right) \frac{\partial x}{\partial t} - \left( \frac{\partial}{\partial t} \frac{\partial x}{\partial t} \right) \frac{\partial y}{\partial t} \\ &= \left[ \frac{\partial}{\partial t} \left( \frac{\partial x}{\partial t} \frac{\partial y}{\partial t} \right) \right] \frac{\partial y}{\partial t} + \left[ \frac{\partial}{\partial t} \left( \frac{\partial y}{\partial t} \frac{\partial x}{\partial t} \right) \right] \frac{\partial x}{\partial t} \\ &\quad - \left[ \frac{\partial}{\partial t} \left( \frac{\partial y}{\partial t} \frac{\partial x}{\partial t} \right) \right] \frac{\partial x}{\partial t} - \left[ \frac{\partial}{\partial t} \left( \frac{\partial x}{\partial t} \frac{\partial y}{\partial t} \right) \right] \frac{\partial y}{\partial t} \\ \frac{\partial \Omega}{\partial t} &= \frac{\partial x}{\partial t} \frac{\partial y}{\partial t} + \frac{\partial y}{\partial t} \frac{\partial x}{\partial t} - \frac{\partial y}{\partial t} \frac{\partial x}{\partial t} - \frac{\partial x}{\partial t} \frac{\partial y}{\partial t} \\ &= 0\end{aligned}$$

$\boxed{\frac{\partial \Omega}{\partial t} = 0}$  (A)

Professor, This is answer of thursday question. It is not relate that mesh doesn't change in time.

This is great! 2.0 points bonus. I would have given you 3 points bonus if you would have typeset it using L<sup>A</sup>T<sub>E</sub>X.

Question by Student 201327132

Professor, Assignment 2 deadline is described Tuesday 29th March. So That confused me.

Its due on Thursday. I fixed the mistake.

Question by Student 201327133

Professor, I have a question about  $\tau$ . I understood that  $\eta$  and  $\xi$  mean each line number of horizontal and vertical grid. But i don't know what is physical meaning of  $\tau$ . If i know that, it much easier to understand the class.

$\tau$  is the same as  $t$  because we set  $\Gamma$  to 1. 1 point bonus.

### Question by Student 201327103

*Professor, I think the problem is  $i$  and  $x$  are not in same direction. In previous example,  $i$  axis and  $x$  axis are in same direction. So that computer can decide  $x$  component first with setted space and then decide  $y$  component from equation*

$$y = \sin(15x/L)H/20$$

*Here the space doesn't change with  $y$  But in this problem space change with  $x$  and  $y$ . So, computer may not find proper point of nodes which have setted space through  $x^2 + y^2 = r^2$ . Because I don't know the computer codes in detail, I can't approach to the solution.*

You're on the right track. It has something to do with the fact that it's difficult to find a root for  $y$  on a circle at  $x = \pm r_i$ . Because the method used to solve the equation within the Equation() command is a Newton-Raphson non-linear root solver, it may fail close to  $x = \pm r_i$  depending on the initial guess or the size of the first  $\Delta x$  given to the solver. Say for example that  $x$  is at  $-r_i$  and  $\Delta x$  is set to  $-10^{-10}$  m, then this will result in a negative value for  $y^2$  in the Newton-Raphson procedure, and the Equation command will fail. I'll explain this better through an example next class. 2 points bonus.

### Question by Student 201227125

*Professor, at assignment 2-Question #3,  $x$  and  $y$  has dimension that is length(unit mm). In this case, dose  $\xi$  and  $\eta$  also have dimension or not?*

No,  $\xi$  and  $\eta$  don't have dimensions. But their derivatives do of course. So  $\xi_x$ ,  $\eta_x$ , etc will have dimensions (1/m or 1/mm). 1 point bonus.

### Question by Student 201227148

*Sir, I can not get my CFD password. I entered my email address. But I can not log in.*

Try again now.
