

# How to Burn a ISO Filesystem on a USB Drive Using the Linux Command Line

First type at the prompt

```
lsblk
```

Insert the USB disk, and type again

```
lsblk
```

From the previous two outputs, it will be clear what the name of your USB drive is. Let's say the name of your USB drive is /dev/sdf. Then, download an ISO image of a linux distro, and burn it on your USB drive as follows:

```
sudo dd bs=4M if=ubuntu-19.04-desktop-amd64.iso of=/dev/sdf conv=fdata  
sync
```
